Variables Package datk.core

2 Package datk.core

A Python Toolkit for Distributed Algorithms

Authors:

- Amin Manna <manna@mit.edu>
- Mayuri Sridhar <mayuri@mit.edu>

2.1 Modules

- algs (Section 3, p. 6)
- distalgs (Section 4, p. 23)
- networks (Section 5, p. 35)
- tester (Section 6, p. 39)

Name	Description
package	Value: None

3 Module datk.core.algs

3.1 Variables

Name	Description
package	Value: 'datk.core'

3.2 Class LCR

datk.core.distalgs.Algorithm — datk.core.distalgs.Synchronous_Algorithm — datk.core.algs.LCR

The LeLann, Chang and Roberts algorithm for Leader Election in a Synchronous Ring Network

Each Process sends its identifier around the ring. When a Process receives an incoming identifier, it compares that identifier to its own. If the incoming identifier is greater than its own, it keeps passing the identifier; if it is less than its own, it discards the incoming identifier; if it is equal to its own, the Process declares itself the leader.

Requires:

• Every process knows state['n'], the size of the network

Effects:

- Every process has state['status'] is 'leader' or 'non-leader'.
- Exactly one process has state['status'] is 'leader'

3.2.1 Methods

 $\mathbf{msgs_i}(\mathit{self}, p)$

Determines what messages a Process, p, will send.

Overrides: datk.core.distalgs.Algorithm.msgs_i extit(inherited documentation)

 $trans_i(self, p, msgs)$

Determines what state transition a Process, p, will perform, having received messages, msgs

Overrides: datk.core.distalgs.Algorithm.trans_i extit(inherited documentation)

 $cleanup_i(self, p)$

Determines what final state transition a Process, p, will perform, after the algorithm terminates.

Overrides: datk.core.distalgs.Algorithm.cleanup_i extit(inherited documentation)

$Inherited\ from\ datk.core.distalgs.Synchronous_Algorithm(Section\ 4.6)$

execute(), msgs(), print_algorithm_terminated(), round(), run(), trans()

Inherited from datk.core.distalgs.Algorithm(Section 4.5)

__call__(), __init__(), cleanup(), count_msg(), delete(), get(), halt(), halt_i(), has(), increment(), output(), set()

3.2.2 Class Variables

Name	Description
Inherited from datk.core.distalgs.Algorithm (Section 4.5)	
DEFAULT, DEFAULT_PAR	AMS, QUIET, SILENT, VERBOSE

3.3 Class AsyncLCR

datk.core.distalgs.Algorithm — datk.core.distalgs.Asynchronous_Algorithm — datk.core.algs.AsyncLCR

The LeLann, Chang and Roberts algorithm for Leader Election in an Asynchronous Ring Network

Each Process sends its identifier around the ring. When a Process receives incoming identifier(s), it compares their largest to its own. If that incoming identifier is greater than its own, it keeps passing that identifier; if it is less than its own, it discards all the incoming identifiers; if it is equal to its own, the Process declares itself the leader. When a Process has declared itself Leader, it sends a Leader Declaration message around the ring, and halts As it goes around the ring, each other Process outputs 'non-leader', and halts.

Requires:

• Every process knows state['n'], the size of the network

Effects:

- Every process has state['status'] is 'leader' or 'non-leader'.
- Exactly one process has state ['status'] is 'leader'

3.3.1 Methods

msgs_i(self, p, verbose=False)

Determines what messages a Process, p, will send.

Overrides: datk.core.distalgs.Algorithm.msgs_i extit(inherited documentation)

trans_i(self, p, verbose=False)

Determines what state transition a Process, p, will perform, having received messages, msgs

Overrides: datk.core.distalgs.Algorithm.trans_i extit(inherited documentation)

 $cleanup_i(self, p)$

Determines what final state transition a Process, p, will perform, after the algorithm terminates.

Overrides: datk.core.distalgs.Algorithm.cleanup_i extit(inherited documentation)

Inherited from datk.core.distalgs.Asynchronous_Algorithm(Section 4.8)

run(), run_process()

 $Inherited\ from\ datk.core.distalgs. Algorithm (Section\ 4.5)$

__call__(), __init__(), cleanup(), count_msg(), delete(), get(), halt(), halt_i(), has(), increment(), output(), print_algorithm_terminated(), set()

3.3.2 Class Variables

Name	Description
Inherited from datk.core.distalgs.Algorithm (Section 4.5)	
DEFAULT, DEFAULT_PAR	AMS, QUIET, SILENT, VERBOSE

3.4 Class FloodMax

datk.core.distalgs.Algorithm — datk.core.distalgs.Synchronous_Algorithm

datk.core.algs.FloodMax

UID flooding algorithm for Leader Election in a general network

Every process maintains a record of the maximum UID it has seen so far (initially its own). At each round, each process propagates this maximum on all of its outgoing edges. After diam rounds, if the maximum value seen is the process's own UID, the process elects itself the leader; otherwise, it is a non-leader.

Requires:

- Every process, p, has p.state["diam"] >= dist(p, q), forall q.
- Alternatively, a process that does not know state ["diam"] will use state ["n"], the size of the network, as a fallback upper bound on diam.

3.4.1 Methods

```
\mathbf{msgs\_i}(\mathit{self}, p)
```

Determines what messages a Process, p, will send.

Overrides: datk.core.distalgs.Algorithm.msgs_i extit(inherited documentation)

```
trans_i(self, p, msgs, verbose=False)
```

Determines what state transition a Process, p, will perform, having received messages, msgs

Overrides: datk.core.distalgs.Algorithm.trans_i extit(inherited documentation)

```
\mathbf{cleanup\_i}(\mathit{self},\ p)
```

Determines what final state transition a Process, p, will perform, after the algorithm terminates.

Overrides: datk.core.distalgs.Algorithm.cleanup_i extit(inherited documentation)

$Inherited\ from\ datk.core.distalgs. Synchronous_Algorithm (Section\ 4.6)$

```
execute(), \ msgs(), \ print\_algorithm\_terminated(), \ round(), \ run(), \ trans()
```

$Inherited\ from\ datk.core.distalgs. Algorithm (Section\ 4.5)$

```
\label{eq:call_optimize} $$\_$call_-(), $\_$init_-(), $cleanup(), $count_msg(), $delete(), $get(), $halt(), $halt_i(), $has(), $increment(), $output(), $set()$
```

3.4.2 Class Variables

Name	Description
Inherited from datk.core.dist	algs. Algorithm (Section 4.5)
DEFAULT, DEFAULT_PAR	AMS, QUIET, SILENT, VERBOSE

3.5 Class SynchBFS

datk.core.distalgs.Algorithm — datk.core.distalgs.Synchronous_Algorithm — datk.core.algs.SynchBFS

Constructs a BFS tree with the 'leader' Process at its root

At any point during execution, there is some set of processes that is "marked," initially just i0. Process i0 sends out a search message at round 1, to all of its outgoing neighbors. At any round, if an unmarked process receives a search message, it marks itself and chooses one of the processes from which the search has arrived as its parent. At the first round after a process gets marked, it sends a search message to all of its outgoing neighbors.

Requires:

• testLeaderElection

Effects:

• every Process has state['parent']. Leader has state['parent'] = None

3.5.1 Methods

 $is_i0(self, p)$

 $msgs_i(self, p)$

Determines what messages a Process, p, will send.

 $Overrides: \ datk.core.distalgs. Algorithm.msgs_i\ extit (inherited\ documentation)$

 $trans_i(self, p, msgs)$

Determines what state transition a Process, p, will perform, having received messages, msgs

Overrides: datk.core.distalgs.Algorithm.trans_i extit(inherited documentation)

$Inherited\ from\ datk.core.distalgs. Synchronous_Algorithm (Section\ 4.6)$

execute(), msgs(), print_algorithm_terminated(), round(), run(), trans()

Inherited from datk.core.distalgs.Algorithm(Section 4.5)

__call__(), __init__(), cleanup_i(), cleanup_i(), count_msg(), delete(), get(), halt(), halt_i(), has(), increment(), output(), set()

3.5.2 Class Variables

Name	Description
Inherited from datk.core.distalgs.Algorithm (Section 4.5)	
DEFAULT, DEFAULT_PAR	AMS, QUIET, SILENT, VERBOSE

3.6 Class SynchBFSAck

datk.core.distalgs.Algorithm — datk.core.distalgs.Synchronous_Algorithm — datk.core.algs.SynchBFSAck

Constructs a BFS tree with children pointers and the 'leader' Process at its root

Algorithm (Informal): At any point during execution, there is some set of processes that is "marked," initially just i0. Process i0 sends out a search message at round 1, to all of its outgoing neighbors. At any round, if an unmarked process receives a search message, it marks itself and chooses one of the processes from which the search arrived as its parent. At the first round after a process gets marked, it sends a search message to all of its outgoing neighbors, and an acknowledgement to its parent, so that nodes will also know their children.

Requires:

• testLeaderElection

Effects:

- Every process knows:
 - state['parent']. Leader has state['parent'] = None
 - state['childen']. Leaves have state['children'] = []

3.6.1 Methods

 $is_i0(self, p)$

 $\mathbf{msgs_i}(\mathit{self}, p)$

Determines what messages a Process, p, will send.

Overrides: datk.core.distalgs.Algorithm.msgs_i extit(inherited documentation)

 $trans_i(self, p, msgs)$

Determines what state transition a Process, p, will perform, having received messages, msgs

Overrides: datk.core.distalgs.Algorithm.trans_i extit(inherited documentation)

Inherited from datk.core.distalgs.Synchronous_Algorithm(Section 4.6)

execute(), msgs(), print_algorithm_terminated(), round(), run(), trans()

Inherited from datk.core.distalgs.Algorithm(Section 4.5)

__call__(), __init__(), cleanup(), cleanup_i(), count_msg(), delete(), get(), halt(), halt_i(), has(), increment(), output(), set()

3.6.2 Class Variables

Name	Description
Inherited from datk.core.distalgs.Algorithm (Section 4.5)	
DEFAULT, DEFAULT_PARAMS, QUIET, SILENT, VERBOSE	

3.7 Class SynchConvergecast

datk.core.distalgs.Algorithm — datk.core.distalgs.Synchronous_Algorithm

datk.core.algs.SynchConvergecast

Known Subclasses: datk.core.algs.SynchConvergeHeight

The abstract superclass of a class of Synchronous Algorithms that propagate information from the leaves of a BFS tree to its root.

Requires:

• Every Process knows state['parent']

3.7.1 Methods

is_root(self, p)

$msgs_i(self, p)$

Determines what messages a Process, p, will send.

Overrides: datk.core.distalgs.Algorithm.msgs_i extit(inherited documentation)

$trans_i(self, p, msgs)$

Determines what state transition a Process, p, will perform, having received messages, msgs

Overrides: datk.core.distalgs.Algorithm.trans_i extit(inherited documentation)

$\mathbf{cleanup}_{-\mathbf{i}}(\mathit{self}, p)$

Determines what final state transition a Process, p, will perform, after the algorithm terminates.

Overrides: datk.core.distalgs.Algorithm.cleanup_i extit(inherited documentation)

 $trans_root(self, p, msgs)$

output_root(self, p)

initial_msg_to_parent(self, p)

 $\mathbf{trans_msg_to_parent}(\mathit{self},\ p,\ \mathit{msgs})$

$Inherited\ from\ datk.core.distalgs. Synchronous_Algorithm (Section\ 4.6)$

 $execute(), msgs(), print_algorithm_terminated(), round(), run(), trans()$

$Inherited\ from\ datk.core.distalgs. Algorithm (Section\ 4.5)$

 $\label{eq:call_optimize} $$_$call_(), $_$init_(), $cleanup(), $count_msg(), $delete(), $get(), $halt(), $halt_i(), $has(), $increment(), output(), $set()$$

3.7.2 Class Variables

Name	Description
Inherited from datk.core.dist	algs. Algorithm (Section 4.5)
DEFAULT, DEFAULT_PAR	AMS, QUIET, SILENT, VERBOSE

3.8 Class AsynchConvergecast

datk.core.distalgs.Algorithm — datk.core.distalgs.Asynchronous_Algorithm — datk.core.algs.AsynchConvergecast

Known Subclasses: datk.core.algs.AsynchConvergeHeight

The abstract superclass of a class of Asynchronous Algorithms that propagate information from the leaves of a BFS tree to its root.

Requires:

• Every Process knows state ['parent'] and state ['children']

3.8.1 Methods

$$is_root(self, p)$$

 $\mathbf{msgs_i}(\mathit{self}, p)$

Determines what messages a Process, p, will send.

 $Overrides: \ datk.core.distalgs.Algorithm.msgs_i\ extit (inherited\ documentation)$

 $trans_i(self, p, msgs)$

Determines what state transition a Process, p, will perform, having received messages, msgs

 $Overrides: \ datk.core.distalgs. Algorithm.trans_i\ extit (inherited\ documentation)$

cleanup_i(self, p)

Determines what final state transition a Process, p, will perform, after the algorithm terminates.

Overrides: datk.core.distalgs.Algorithm.cleanup_i extit(inherited documentation)

trans_root(self, p, msgs)

Determines the state transition the root node should undergo when it receives messages

Parameters

p: the root Process

msgs: the messages received by the root Process, from its BFS children

$\mathbf{output_root}(\mathit{self}, p)$

Determines the output action, if any, that the root should perform at the end of the Convergecast.

$initial_msg_to_parent(self, p)$

Defines the initial message sent from a leaf process to its parent at the beginning of the Convergecast

Parameters

p: A Process at a leaf of the BFS tree

Return Value

the Message p should send to its state ['parent']

trans_msg_to_parent(self, p, msgs)

Defines the message a non-leaf, non-root Process should send to its parent when it has received all its children's messages

Parameters

p: a Process that has both p.state['parent'] != null, and p.state['children'] not empty

msgs: A list of messages from every child of p (in p.state['children'])

Return Value

the Message p should send to its state['parent']

Inherited from datk.core.distalgs.Asynchronous_Algorithm(Section 4.8)

run(), run_process()

Inherited from datk.core.distalgs.Algorithm(Section 4.5)

__call__(), __init__(), cleanup(), count_msg(), delete(), get(), halt(), halt_i(), has(), increment(), output(), print_algorithm_terminated(), set()

3.8.2 Class Variables

Name	Description
Inherited from datk.core.distalgs.Algorithm (Section 4.5)	
DEFAULT, DEFAULT_PARAMS, QUIET, SILENT, VERBOSE	

3.9 Class SynchConvergeHeight

datk.core.distalgs.Algorithm —

datk.core.distalgs.Synchronous_Algorithm —

datk.core.algs.SynchConvergecast —

datk.core.algs.SynchConvergeHeight

A Convergecast Algorithm that results in the root node, p, knowing p.state['height'], the height of the tree rooted at p.

Requires:

• BFS Tree

Effects:

• Root Process knows height of tree in state["height"]

3.9.1 Methods

$cleanup_i(self, p)$

Determines what final state transition a Process, p, will perform, after the algorithm terminates.

Overrides: datk.core.distalgs.Algorithm.cleanup_i extit(inherited documentation)

initial_msg_to_parent(self, p)

 $Overrides: \ datk.core.algs. Synch Converge cast.initial_msg_to_parent$

 $\mathbf{output_root}(\mathit{self}, p)$

Overrides: datk.core.algs.SynchConvergecast.output_root

trans_msg_to_parent(self, p, msgs)

Overrides: datk.core.algs.SynchConvergecast.trans_msg_to_parent

 $trans_root(self, p, msgs)$

Overrides: datk.core.algs.SynchConvergecast.trans_root

 $Inherited\ from\ datk.core.algs.SynchConvergecast(Section\ 3.7)$

is_root(), msgs_i(), trans_i()

Inherited from datk.core.distalgs.Synchronous_Algorithm(Section 4.6)

execute(), msgs(), print_algorithm_terminated(), round(), run(), trans()

Inherited from datk.core.distalgs.Algorithm(Section 4.5)

 $_{-call}(), _{-init}(), _{-i$

3.9.2 Class Variables

Name	Description
Inherited from datk.core.distalgs.Algorithm (Section 4.5)	
DEFAULT, DEFAULT_PARAMS, QUIET, SILENT, VERBOSE	

3.10 Class AsynchConvergeHeight

datk.core.distalgs.Algorithm — datk.core.distalgs.Asynchronous_Algorithm — datk.core.algs.AsynchConvergecast

datk.core.algs.AsynchConvergeHeight

A Convergecast Algorithm that results in the root node, p, knowing p.state['height'], the

height of the tree rooted at p.

Requires:

• BFS Tree

Effects:

• Root Process knows height of tree in state["height"]

3.10.1 Methods

$cleanup_i(self, p)$

Determines what final state transition a Process, p, will perform, after the algorithm terminates.

Overrides: datk.core.distalgs.Algorithm.cleanup_i extit(inherited documentation)

$initial_msg_to_parent(self, p)$

Defines the initial message sent from a leaf process to its parent at the beginning of the Convergecast

Parameters

p: A Process at a leaf of the BFS tree

Return Value

the Message p should send to its state ['parent']

Overrides: datk.core.algs.AsynchConvergecast.initial_msg_to_parent extit(inherited documentation)

$\mathbf{output_root}(\mathit{self}, p)$

Determines the output action, if any, that the root should perform at the end of the Convergecast.

Overrides: datk.core.algs.AsynchConvergecast.output_root extit(inherited documentation)

trans_msg_to_parent(self, p, msgs)

Defines the message a non-leaf, non-root Process should send to its parent when it has received all its children's messages

Parameters

p: a Process that has both p.state['parent'] != null, and p.state['children'] not empty

msgs: A list of messages from every child of p (in p.state['children'])

Return Value

the Message p should send to its state['parent']

Overrides: datk.core.algs.AsynchConvergecast.trans_msg_to_parent extit(inherited documentation)

trans_root(self, p, msgs)

Determines the state transition the root node should undergo when it receives messages

Parameters

p: the root Process

msgs: the messages received by the root Process, from its BFS children

Overrides: datk.core.algs.AsynchConvergecast.trans_root extit(inherited documentation)

$Inherited\ from\ datk.core.algs. A synch Converge cast (Section\ 3.8)$

 $is_root(), msgs_i(), trans_i()$

$Inherited\ from\ datk.core.distalgs. A synchronous_Algorithm (Section\ 4.8)$

 $\operatorname{run}(), \operatorname{run_process}()$

Inherited from datk.core.distalgs.Algorithm(Section 4.5)

__call__(), __init__(), cleanup(), count_msg(), delete(), get(), halt(), halt_i(), has(), increment(), output(), print_algorithm_terminated(), set()

3.10.2 Class Variables

Name	Description
Inherited from datk.core.distalgs.Algorithm (Section 4.5)	
DEFAULT, DEFAULT_PARAMS, QUIET, SILENT, VERBOSE	

3.11 Class SynchBroadcast

Broadcasts a value stored in Process, p, to the BFS tree rooted at p

Requires:

- The attribute to be broadcasted must be specified in self.params['attr']
- BFS Tree with children pointers, where root node has state[self.params['attr']]

Effects:

• All Processes have state[self.params['attr']] := the original value of in state[self.params['attr']] of the root Process.

For example: If the root Process, p, knows p.state['min_UID'] = 4. Then after the execution, all Processes q in the Network know q.state['min_UID'].

3.11.1 Methods

$\mathbf{msgs_i}(\mathit{self}, p)$

Determines what messages a Process, p, will send.

Overrides: datk.core.distalgs.Algorithm.msgs_i extit(inherited documentation)

$\mathbf{trans}_{-\mathbf{i}}(\mathit{self},\ p,\ \mathit{msgs})$

Determines what state transition a Process, p, will perform, having received messages, msgs

Overrides: datk.core.distalgs.Algorithm.trans_i extit(inherited documentation)

$\mathbf{cleanup_i}(\mathit{self},\ p)$

Determines what final state transition a Process, p, will perform, after the algorithm terminates.

Overrides: datk.core.distalgs.Algorithm.cleanup_i extit(inherited documentation)

Inherited from datk.core.distalgs.Synchronous_Algorithm(Section 4.6)

execute(), msgs(), print_algorithm_terminated(), round(), run(), trans()

Inherited from datk.core.distalgs.Algorithm(Section 4.5)

call(), _init_(), cleanup(), count_msg(), delete(), get(), halt(), halt_i(), has(), increment(), output(), set()

3.11.2 Class Variables

Name	Description	
Inherited from datk.core.distalgs.Algorithm (Section 4.5)		
DEFAULT, DEFAULT_PARAMS, QUIET, SILENT, VERBOSE		

3.12 Class SynchLubyMIS

datk.core.distalgs.Algorithm — datk.core.distalgs.Synchronous_Algorithm — datk.core.algs.SynchLubyMIS

A randomized algorithm that constructs a Maximal Independent Set

The algorithm works in stages, each consisting of three rounds.

- Round 1: In the first round of a stage, the processes choose their respective vals and send them to their neighbors. By the end of round 1, when all the val messages have been received, the winners—that is, the processes in F–know who they are.
- Round 2: In the second round, the winners notify their neighbors. By the end of round 2, the losers—that is, the processes having neighbors in F–know who they are.
- Round 3: In the third round, each loser notifies its neighbors. Then all the involved processes—the winners, the losers, and the losers' neighbors—remove the appropriate nodes and edges from the graph. More precisely, this means the winners and losers discontinue participation after this stage, and the losers' neighbors remove all the edges that are incident on the newly removed nodes.

Requires:

• Every process knows state['n'], the size of the network

Effect:

• Every process knows state ['MIS']. A boolean representing whether it is a member of the Maximal Independent Set found by Luby's algorithm.

3.12.1 Methods

 $\mathbf{msgs_i}(self, p)$

Determines what messages a Process, p, will send.

Overrides: datk.core.distalgs.Algorithm.msgs_i extit(inherited documentation)

 $trans_i(self, p, msgs)$

Determines what state transition a Process, p, will perform, having received messages, msgs

Overrides: datk.core.distalgs.Algorithm.trans_i extit(inherited documentation)

Inherited from datk.core.distalgs.Synchronous_Algorithm(Section 4.6)

execute(), msgs(), print_algorithm_terminated(), round(), run(), trans()

Inherited from datk.core.distalgs.Algorithm(Section 4.5)

__call__(), __init__(), cleanup(), cleanup_i(), count_msg(), delete(), get(), halt(), halt_i(), has(), increment(), output(), set()

3.12.2 Class Variables

Name	Description
Inherited from datk.core.distalgs.Algorithm (Section 4.5)	
DEFAULT, DEFAULT_PARAMS, QUIET, SILENT, VERBOSE	

4 Module datk.core.distalgs

4.1 Variables

Name	Description
package	Value: 'datk.core'

4.2 Class Message

Known Subclasses: datk.core.algs.AsyncLCR.Leader_Declaration, datk.core.algs.SynchBFS.Search, datk.core.algs.SynchBFSAck.AckParent, datk.core.algs.SynchBFSAck.Search

A Message

Attributes:

• content: The content of this Message

• algorithm: The Algorithm that required the sending of this Message

• author: The Process that sent it

4.2.1 Methods

$__init__(self, algorithm, content=None)$		
Parameters		
algorithm:	the Algorithm that required the sending of this Message	
content:	The content of this Message. Can be any type, including None.	

```
\_str\_(self)
```

4.3 Class Process

A computing element located at a node of a network graph. Processes are identical except for their UID

4.3.1 Methods

$$_$$
init $_$ ($self$, UID , $state = None$, $in_nbrs = []$, $out_nbrs = []$)

link_to(self, new_out_nbr)

Adds a new outgoing neighbor of the Process

 $\mathbf{bi_link}(self, nbr)$

Adds a new out_nbr of the Process, and adds the Process as an out_nbr of that neighbor

output(self, key, val, verbose=True)

Sets the publicly visible value of self.state[key] to val

Parameters

key: The state variable to set

val: The value to assign to it

verbose: Dictates whether or not to print this event to STDOUT

send_to_all_neighbors(self, msg)

Sends a message to all out_nbrs

Parameters

msg: the message to send

send_msg(self, msg, out_nbrs=None)

Sends a Message from Process to some subset of out_nbrs

Parameters

msg: The message to send.

out_nbrs: The out_nbrs to send the message to. This may be a

subset of the Process's out_nbrs, or None, in which case

the message will be sent to all out_nbrs

Effects:

• Sets msg.author = self

get_msgs(self, algorithm, in_nbrs=None)

Removes all Messages that relate to a particular Algorithm from the Process' incoming channels (or from some subset of incoming channels). Returns them.

Parameters

algorithm: the algorithm whose messages this returns

in_nbrs: the in_nbrs of the Process from whose channels we are

getting messages. If None, fetches messages from all

channels

Return Value

A list of Messages, msgs, such that every message in msgs has Algorithm algorithm, and author in in_nbrs

add(self, algorithm)

Causes the Process to wake up with respect to algorithm

terminate(self, algorithm)

Causes the Process to halt execution of algorithm

 $_$ str $_$ (self)

 $_$ repr $_$ (self)

4.4 Class Network

Known Subclasses: datk.core.networks.Bidirectional_Line, datk.core.networks.Bidirectional_Ring, datk.core.networks.Complete_Graph, datk.core.networks.Random_Line_Network, datk.core.networks.Unididatk.core.networks.Unidirectional_Ring

A collection of Processes that know n, the # of processes in the network.

4.4.1 Methods

 $_$ getitem $_$ (self, i)

 $_$ init $_$ (self, n, $index_to_UID$ =None)

Creates a network of n disconnected Processes, with random distinct UIDs, or as specified by the index_to_UID function

$_$ iter $_$ ($self$)
$_$ len $_$ ($self$)
$_$ repr $_$ ($self$)
odd(salf algorithm)
$\mathbf{add}(\mathit{self}, \mathit{algorithm})$
Awakens all Processes in the Network with respect to algorithm
$\overline{\mathbf{clone}(\mathit{self})}$
cione(seij)
1 (10)
$\mathbf{draw}(self)$
Draws the Network
index(self, p)
run(self, algorithm)
Runs algorithm on the Network
$\mathbf{state}(\mathit{self})$
Return Value
A text representation of the state of all the Processes in the Network

4.5 Class Algorithm

 ${\bf Known~Subclasses:}~ {\bf datk.core.distalgs.Asynchronous_Algorithm,~datk.core.distalgs.Chain,~datk.core.distalgs.Synchronous_Algorithm}$

Abstract superclass for a distributed algorithm.

4.5.1 Methods

 $_init_(self, network=None, params=\{\}, name=None)$

Parameters

network: [Optional] network. If specified, algorithm is immediately

executed on network.

params: [Optional] runtime parameters.

name: [Optional] name of the Algorithm instance. Defaults to

class name.

$msgs_i(self, p)$

Determines what messages a Process, p, will send.

$trans_i(self, p, msgs)$

Determines what state transition a Process, p, will perform, having received messages, msgs

$\mathbf{halt}_{\mathbf{i}}(self, p)$

Returns True iff Process p has halted execution of the algorithm

$cleanup_i(self, p)$

Determines what final state transition a Process, p, will perform, after the algorithm terminates.

cleanup(self)

Calls cleanup_i on all processes

$_$ call $_$ (self, network, params={})

Same as run, allows an algorithm, A, to be executed like this: A()

run(self, network, params={})

Executes the algorithm on the network

Parameters

network: the parameter to run in

params: runtime parameters

halt(self)

print_algorithm_terminated(self)

count_msg(self, message_count)

set(self, process, state, value)

increment(self, process, state, inc=1)

has(self, process, state)

get(self, process, state)

delete(self, process, state)

output(self, process, key, val)

Sets the publicly visible value of process.state[key] to val

This command is verbose if Algorithm's verbosity is >= DEFAULT

Parameters

key: The state variable to setval: The value to assign to it

4.5.2 Class Variables

Name	Description
DEFAULT_PARAMS	Value: {'draw': False, 'verbosity': 1}
DEFAULT	Value: 2
QUIET	Value: 1
SILENT	Value: 0
VERBOSE	Value: 3

4.6 Class Synchronous_Algorithm

 $datk.core.distalgs. Algorithm \ -$

$datk.core.distalgs. Synchronous_Algorithm$

Known Subclasses: datk.core.distalgs.Compose, datk.core.distalgs.Do_Nothing, datk.core.algs.FloodMaxdatk.core.algs.LCR, datk.core.algs.SynchBFS, datk.core.algs.SynchBFSAck, datk.core.algs.SynchBroadcas

datk.core.algs.SynchConvergecast, datk.core.algs.SynchLubyMIS

We assume that Processes take steps simultaneously, that is, that execution proceeds in synchronous rounds.

4.6.1 Methods

execute(self)

msgs(self)

print_algorithm_terminated(self)

Overrides: datk.core.distalgs.Algorithm.print_algorithm_terminated

round(self)

Executes a single round of the Synchronous Algorithm

run(self, network, params={})

Executes the algorithm on the network

Parameters

network: the parameter to run in

params: runtime parameters

Overrides: datk.core.distalgs.Algorithm.run extit(inherited documentation)

trans(self)

Inherited from datk.core.distalgs.Algorithm(Section 4.5)

__call__(), __init__(), cleanup(), cleanup_i(), count_msg(), delete(), get(), halt(), halt_i(), has(), increment(), msgs_i(), output(), set(), trans_i()

4.6.2 Class Variables

Name	Description
Inherited from datk.core.distalgs.Algorithm (Section 4.5)	
DEFAULT, DEFAULT_PARAMS, QUIET, SILENT, VERBOSE	

4.7 Class Do_Nothing

datk.core.distalgs.Algorithm — datk.core.distalgs.Synchronous_Algorithm — datk.core.distalgs.Do_Nothing

4.7.1 Methods

trans_i(self, p, messages)

Determines what state transition a Process, p, will perform, having received messages, msgs

Overrides: datk.core.distalgs.Algorithm.trans_i extit(inherited documentation)

Inherited from datk.core.distalgs.Synchronous_Algorithm(Section 4.6)

execute(), msgs(), print_algorithm_terminated(), round(), run(), trans()

Inherited from datk.core.distalgs.Algorithm(Section 4.5)

__call__(), __init__(), cleanup(), cleanup_i(), count_msg(), delete(), get(), halt(), halt_i(), has(), increment(), msgs_i(), output(), set()

4.7.2 Class Variables

Name	Description
Inherited from datk.core.distalgs.Algorithm (Section 4.5)	
DEFAULT, DEFAULT_PARAMS, QUIET, SILENT, VERBOSE	

4.8 Class Asynchronous_Algorithm

datk.core.distalgs.Algorithm — datk.core.distalgs.Asynchronous_Algorithm

Known Subclasses: datk.core.algs.AsyncLCR, datk.core.algs.AsynchConvergecast

We assume that the separate Processes take steps in an arbitrary order, at arbitrary relative speeds.

4.8.1 Methods

run(self, network, params={})

Executes the algorithm on the network

Parameters

 ${\tt network:}\ \ {\tt the}\ {\tt parameter}\ \ {\tt to}\ \ {\tt run}\ \ {\tt in}$

params: runtime parameters

Overrides: datk.core.distalgs.Algorithm.run extit(inherited documentation)

run_process(self, process)

$Inherited\ from\ datk.core.distalgs.Algorithm(Section\ 4.5)$

__call__(), __init__(), cleanup(), cleanup_i(), count_msg(), delete(), get(), halt(), halt_i(), has(), increment(), msgs_i(), output(), print_algorithm_terminated(), set(), trans_i()

4.8.2 Class Variables

Name	Description
Inherited from datk.core.distalgs.Algorithm (Section 4.5)	
DEFAULT, DEFAULT_PARAMS, QUIET, SILENT, VERBOSE	

4.9 Class Compose

datk.core.distalgs.Algorithm — datk.core.distalgs.Synchronous_Algorithm — datk.core.distalgs.Compose

A Synchonous_Algorithm that is the composition of two synchronous algorithms running in parallel.

4.9.1 Methods

_init__(self, A, B, name=None, params=None)

Parameters

A: an instance of Synchronous_Algorithm

B: an instance of Synchronous_Algorithm

name: [Optional] name of the Algorithm. Defaults to

Compose(name of A, name of B)

params: [Optional] Runtime parameters

Overrides: datk.core.distalgs.Algorithm._init_

$\mathbf{msgs_i}(\mathit{self}, p)$

Determines what messages a Process, p, will send.

Overrides: datk.core.distalgs.Algorithm.msgs_i extit(inherited documentation)

$trans_i(self, p, msgs)$

Determines what state transition a Process, p, will perform, having received messages, msgs

Overrides: datk.core.distalgs.Algorithm.trans_i extit(inherited documentation)

$\mathbf{halt}_{-\mathbf{i}}(self, p)$

Returns True iff Process p has halted execution of the algorithm

Overrides: datk.core.distalgs.Algorithm.halt_i extit(inherited documentation)

$cleanup_i(self, p)$

Determines what final state transition a Process, p, will perform, after the algorithm terminates.

Overrides: datk.core.distalgs.Algorithm.cleanup_i extit(inherited documentation)

run(self, network, params={})

Executes the algorithm on the network

Parameters

network: the parameter to run in

params: runtime parameters

Overrides: datk.core.distalgs.Algorithm.run extit(inherited documentation)

 $_$ repr $_$ (self)

Inherited from datk.core.distalgs.Synchronous_Algorithm(Section 4.6)

execute(), msgs(), print_algorithm_terminated(), round(), trans()

Inherited from datk.core.distalgs.Algorithm(Section 4.5)

__call__(), cleanup(), count_msg(), delete(), get(), halt(), has(), increment(), output(), set()

4.9.2 Class Variables

Name	Description
Inherited from datk.core.distalgs.Algorithm (Section 4.5)	
DEFAULT, DEFAULT_PARAMS, QUIET, SILENT, VERBOSE	

4.10 Class Chain

datk.core.distalgs.Algorithm — datk.core.distalgs.Chain

An Algorithm that is the result of sequentially running two algorithms

4.10.1 Methods

 $_init_(self, A, B, name = None, params = None)$

Parameters

A: an instance of Algorithm

B: an instance of Algorithm

name: [Optional] name of the Algorithm. Defaults to

Chain(A.name, B.name)

params: [Optional] Runtime parameters

Overrides: datk.core.distalgs.Algorithm.__init__

 $\mathbf{run}(\mathit{self}, \mathit{network}, \mathit{params} {=} \{\})$

Executes the algorithm on the network

Parameters

network: the parameter to run in

params: runtime parameters

Overrides: datk.core.distalgs.Algorithm.run extit(inherited documentation)

__repr__(self)

Inherited from datk.core.distalgs.Algorithm(Section 4.5)

__call__(), cleanup(), cleanup_i(), count_msg(), delete(), get(), halt(), halt_i(), has(), increment(), msgs_i(), output(), print_algorithm_terminated(), set(), trans_i()

4.10.2 Class Variables

Name	Description
Inherited from datk.core.distalgs.Algorithm (Section 4.5)	
DEFAULT, DEFAULT_PARAMS, QUIET, SILENT, VERBOSE	

5 Module datk.core.networks

5.1 Variables

Name	Description
package	Value: 'datk.core'

5.2 Class Unidirectional_Ring

datk.core.distalgs.Network -

datk.core.networks.Unidirectional_Ring

A Network of n Processes arranged in a ring. Each edge is directed from a Process to its clockwise neighbor, that is, messages can only be sent in a clockwise direction.

5.2.1 Methods

$$_$$
init $_$ ($self$, n , $index_to_UID$ =None)

Creates a network of n disconnected Processes, with random distinct UIDs, or as specified by the index_to_UID function

Overrides: datk.core.distalgs.Network.__init__ extit(inherited documentation)

$Inherited\ from\ datk.core.distalgs.Network (Section\ 4.4)$

$$\label{eq:condition} $$ $_{\text{c}}(), $_{\text$$

5.3 Class Bidirectional_Ring

datk.core.distalgs.Network -

$datk.core.networks.Bidirectional_Ring$

A Network of n Processes arranged in a ring. Each edge between a Process and its neighbor is undirected, that is, messages can be sent in both the clockwise and the counterclockwise directions.

5.3.1 Methods

$$_$$
init $_$ ($self$, n , $index_to_UID$ =None)

Creates a network of n disconnected Processes, with random distinct UIDs, or as specified by the index_to_UID function

Overrides: datk.core.distalgs.Network.__init__ extit(inherited documentation)

Inherited from datk.core.distalgs.Network(Section 4.4)

5.4 Class Unidirectional Line

datk.core.distalgs.Network -

datk.core.networks.Unidirectional_Line

A Network of n Processes arranged in a line. Each edge is directed from a Process to its clockwise neighbor, that is, messages can only be sent in a clockwise direction.

5.4.1 Methods

$$_$$
init $_$ ($self$, n , $index_to_UID$ =None)

Creates a network of n disconnected Processes, with random distinct UIDs, or as specified by the index_to_UID function

Overrides: datk.core.distalgs.Network.__init__ extit(inherited documentation)

$Inherited\ from\ datk.core.distalgs.Network(Section\ 4.4)$

$$\label{eq:condition} $$_{\text{e}}$ = $_{\text{e}}(), =_{\text{e}}(), =_{\text{e$$

5.5 Class Bidirectional_Line

datk.core.distalgs.Network — datk.core.networks.Bidirectional_Line

A Network of n Processes arranged in a line. Each edge between a Process and its neighbor is undirected, that is, messages can be sent in both the clockwise and the counterclockwise

directions.

5.5.1 Methods

Creates a network of n disconnected Processes, with random distinct UIDs, or as specified by the index_to_UID function

Overrides: datk.core.distalgs.Network.__init__ extit(inherited documentation)

Inherited from datk.core.distalgs.Network(Section 4.4)

5.6 Class Complete_Graph

datk.core.distalgs.Network -

datk.core.networks.Complete_Graph

A Network of n Processes arranged at the vertices of a Complete undirected graph of size n.

5.6.1 Methods

Creates a network of n disconnected Processes, with random distinct UIDs, or as specified by the index_to_UID function

Overrides: datk.core.distalgs.Network.__init__ extit(inherited documentation)

Inherited from datk.core.distalgs.Network(Section 4.4)

5.7 Class Random_Line_Network

 ${\it datk.core.distalgs.Network} \ -$

datk.core.networks.Random_Line_Network

A Network of n processes arranged randomly at the vertices of a connected undirected line graph of size n. Additional pairs of vertices are connected at random with a probability that is inversely proportional to the difference in their positions on the line.

For example, the Process at index 3 is guaranteed to be connected to the Process at index 4, and is more likely to be connected to the Process at index 5 than to the Process at index 8.

5.7.1 Methods

```
-_init__(self, n, sparsity=1)

sparsity = 0 -> a Complete_Graph(n) sparsity = infinity -> a
Bidirectional_Line(n)

Overrides: datk.core.distalgs.Network.__init__
```

Inherited from datk.core.distalgs.Network(Section 4.4)

```
__getitem__(), __iter__(), __len__(), __repr__(), add(), clone(), draw(), index(), run(), state()
```

Variables Module datk.core.tester

6 Module datk.core.tester

6.1 Functions

 $test(f=None, timeout=5, main_thread=False, test=True)$

Decorator function test to run distributed algorithm tests in safe environment. Logs failed tests.

Parameters

f: the test (a function) to run.

timeout: the number of seconds to allow the test to run, before

timing it out (causing it to fail).

main_thread: True iff the test cannot run on a thread other than

the main thread.

test: If false, skips testing this function. Useful because it

can be set to default to false, and then set to True for

a select few tests currently being tested.

print_with_underline(text)

summarize()

Called at the end of a test suite. Prints out summary of failed tests

benchmark(Algorithm, Network, test)

Benchmarks the Algorithm on a given class of Networks. Samples variable network size, and plots results.

Parameters

Algorithm: a subclass of Synchronous Algorithm, the algorithm to

test.

Network: a subclass of Network, the network on which to

benchmark the algorithm.

test: a function that may throw an assertion error

Name	Description
TIMEOUT	Value: 5
package	Value: 'datk.core'

Variables Package datk.tests

7 Package datk.tests

7.1 Modules

• helpers: Helper functions for tests in tests.py (Section 8, p. 41)

• networks_tests: Network Test Suite (Section 9, p. 42)

• tests: Algorithm Test Suite (Section 10, p. 43)

Name	Description
package	Value: None

8 Module datk.tests.helpers

Helper functions for tests in tests.py

8.1 Functions

testLeaderElection(network, isLeader = < function < lambda> at 0x4473c70>, isNonleader = < function < lambda> at 0x4473d30>)

Asserts that exactly one Process is Leader, and all other processes are Non-Leader

testBroadcast(network, attr)

Asserts that p.state[attr] is identical for all processes p

testBFS(network)

Asserts that every Process, p, knows 'parent', and there exists exactly one Process where 'parent' is None

testBFSWithChildren(network)

Asserts that every Process, p, knows 'parent' and 'children', and there exists exactly one Process where 'parent' is None

testLubyMIS(network)

Asserts that every process knows a boolean value, 'MIS', and that the Processes where 'MIS' is True form a set that is both independent and maximal.

Name	Description
package	Value: 'datk.tests'

9 Module datk.tests.networks_tests

Network Test Suite

Tests Netwoks defined in networks.py by visual inspection

Name	Description
ip	Value: get_ipython()
DRAW_RANDOM	Value: None
DRAW_HUGE_RANDOM	Value: None
DRAW_UNI_RING	Value: None
